

Carbon Pollution? **Yeah!**

Filthy? **Yeah!**

Coal Fired Power Stations? **Even Worse!!**

Bayswater Power Station Australia

**But it isn't true.** The emissions from coal-fired power stations consist of **perfectly** clean water vapour – **steam** – plus a small amount of **carbon dioxide (CO<sub>2</sub>)** – an invisible, clean, non-polluting gas that is non-toxic to animals, and essential food for plants.

The Clean Air act of 1961 in NSW (followed by the other states) does not permit emissions of pollutants such as carbon monoxide, ozone, sulphur dioxide, nitrogen dioxide, lead and solid particles. **Carbon Pollution** consists of solid particles of **carbon** in the form of **soot**. It does not mean **CO<sub>2</sub>** emissions!

**Don't let the Climate Alarmists worry you.**
